

IN THE CLAIMS

The following listing of the claims is provided in accordance with 37 C.F.R. §1.121.

1. (original) A method for generating a three-dimensional dataset, the method comprising the acts of:

acquiring a plurality of projection images from different locations on an arbitrary imaging trajectory; and

reconstructing the plurality of projection images to form a three-dimensional dataset.

2. (original) The method as recited in claim 1, comprising the act of:
visualizing a selected volume of the three-dimensional dataset.

3. (original) The method as recited in claim 1, comprising the act of:
processing at least one of the plurality of projection images, the three dimensional dataset, and a volume subset of the three-dimensional dataset using a CAD algorithm.

4. (original) The method as recited in claim 1, comprising the act of:
processing at least one of the plurality of projection images, the three dimensional dataset, and a volume subset of the three-dimensional dataset prior to processing by a CAD algorithm or to visualization.

5. (original) The method as recited in claim 1, wherein acquiring the plurality of projection images comprises:
emitting X-rays from one or more X-ray sources at a plurality of locations on the arbitrary imaging trajectory; and

generating at least one projection image corresponding to each location from which X-rays are emitted.

6. (original) The method as recited in claim 1, wherein acquiring the plurality of projection images comprises:

moving an X-ray source along the arbitrary imaging trajectory;
emitting X-rays from the X-ray source at a plurality of locations on the arbitrary imaging trajectory; and

generating at least one projection image corresponding to each location from which X-rays are emitted.

7. (original) The method as recited in claim 1, wherein acquiring the plurality of projection images comprises:

emitting X-rays from a plurality of X-ray sources, wherein each X-ray source may be positioned at one or more locations on the arbitrary imaging trajectory and wherein only one X-ray source is active at a time; and

generating at least one projection image corresponding to each location from which X-rays are emitted.

8. (original) The method as recited in claim 7, wherein each X-ray source is stationary.

9. (original) The method as recited in claim 1, wherein the three-dimensional dataset comprises mammography image data.

10. (currently amended) A tangible, machine readable media, comprising:
code adapted to control acquisition of ~~acquire~~ a plurality of projection images from different locations on an arbitrary imaging trajectory; and

code adapted to reconstruct the plurality of projection images to form a three-dimensional dataset.

11. (original) The tangible, machine readable media, as recited in claim 10, comprising:

code adapted to visualize a selected volume of the three-dimensional dataset.

12. (original) The tangible, machine readable media, as recited in claim 10, comprising:

code adapted to process at least one of the plurality of projection images, the three dimensional dataset, and a volume subset of the three-dimensional dataset using a CAD algorithm.

13. (original) The tangible, machine readable media, as recited in claim 10, comprising:

code adapted to process at least one of the plurality of projection images, the three dimensional dataset, and a volume subset of the three-dimensional dataset prior to processing by a CAD algorithm or to visualization.

14. (currently amended) The tangible, machine readable media, as recited in claim 10, ~~wherein the code adapted to acquire the plurality of projection images emits comprising code adapted to control emission of X-rays from one or more X-ray sources at a plurality of locations on the arbitrary imaging trajectory and generates at least one projection image corresponding to each location from which X-rays are emitted.~~

15. (original) The tangible, machine readable media, as recited in claim 10, wherein the code adapted to acquire the plurality of projection images moves an X-ray source along the arbitrary imaging trajectory, emits X-rays from the X-ray source at a

plurality of locations on the arbitrary imaging trajectory, and generates at least one projection image corresponding to each location from which X-rays are emitted.

16. (original) The tangible, machine readable media, as recited in claim 10, wherein the code adapted to acquire the plurality of projection images emits X-rays from a plurality of X-ray sources, wherein each X-ray source may be positioned at one or more locations on the arbitrary imaging trajectory and wherein only one X-ray source is active at a time, and generates at least one projection image corresponding to each location from which X-rays are emitted.

17. (original) An imaging system, comprising:
means for acquiring a plurality of projection images from different locations on an arbitrary imaging trajectory; and
means for reconstructing the plurality of projection images to form a three-dimensional dataset.

18. (original) An imaging system, comprising:
an X-ray source configured to move along an arbitrary imaging trajectory;
a positioner configured to move at least the X-ray source;
a system controller configured to operate the X-ray source;
a detector configured to detect X-rays emitted by the X-ray source at different locations on the arbitrary imaging trajectory and to generate signals in response to the detected X-rays; and
a detector interface configured to acquire the signals from the detector.

19. (original) The imaging system, as recited in claim 18, comprising:
a reconstruction workstation configured to reconstruct image data from the signals acquired by the detector interface.

20. (original) The imaging system, as recited in claim 18, comprising:
a review workstation configured to display images reconstructed from the signals
acquired by the detector interface.

21. (original) The imaging system, as recited in claim 18, comprising:
a picture archiving system configured to store data from at least one of the system
controller, a reconstruction workstation, and a review workstation.

22. (original) An imaging system, comprising:
a plurality of X-ray sources, wherein each X-ray source is located at different
location on an arbitrary imaging trajectory and wherein each X-ray source is individually
activated;
a system controller configured to operate the plurality of X-ray sources;
a detector configured to detect X-rays emitted by each respective X-ray source and
to generate signals in response to the detected X-rays; and
a detector interface configured to acquire the signals from the detector.

23. (original) The imaging system, as recited in claim 22, comprising:
a reconstruction workstation configured to reconstruct image data from the signals
acquired by the detector interface.

24. (original) The imaging system, as recited in claim 22, comprising:
a review workstation configured to display images reconstructed from the signals
acquired by the detector interface.

25. (original) The imaging system, as recited in claim 22, comprising:
a picture archiving system configured to store data from at least one of the system
controller, a reconstruction workstation, and a review workstation.
